Use OpenFace to process videos and organize its generated dataframes
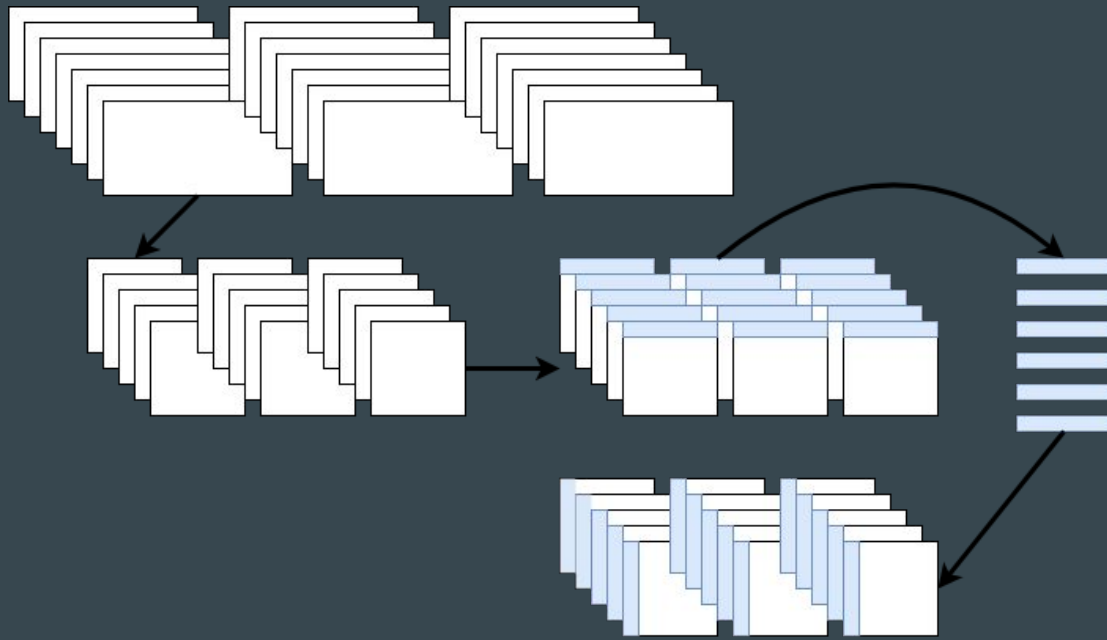

Make dataframe smaller –
Get rid of variables like
head position, eye gaze,
etc. that we don't need

Realize that we need data that's only located in the name of the dataframe, not the dataframe itself
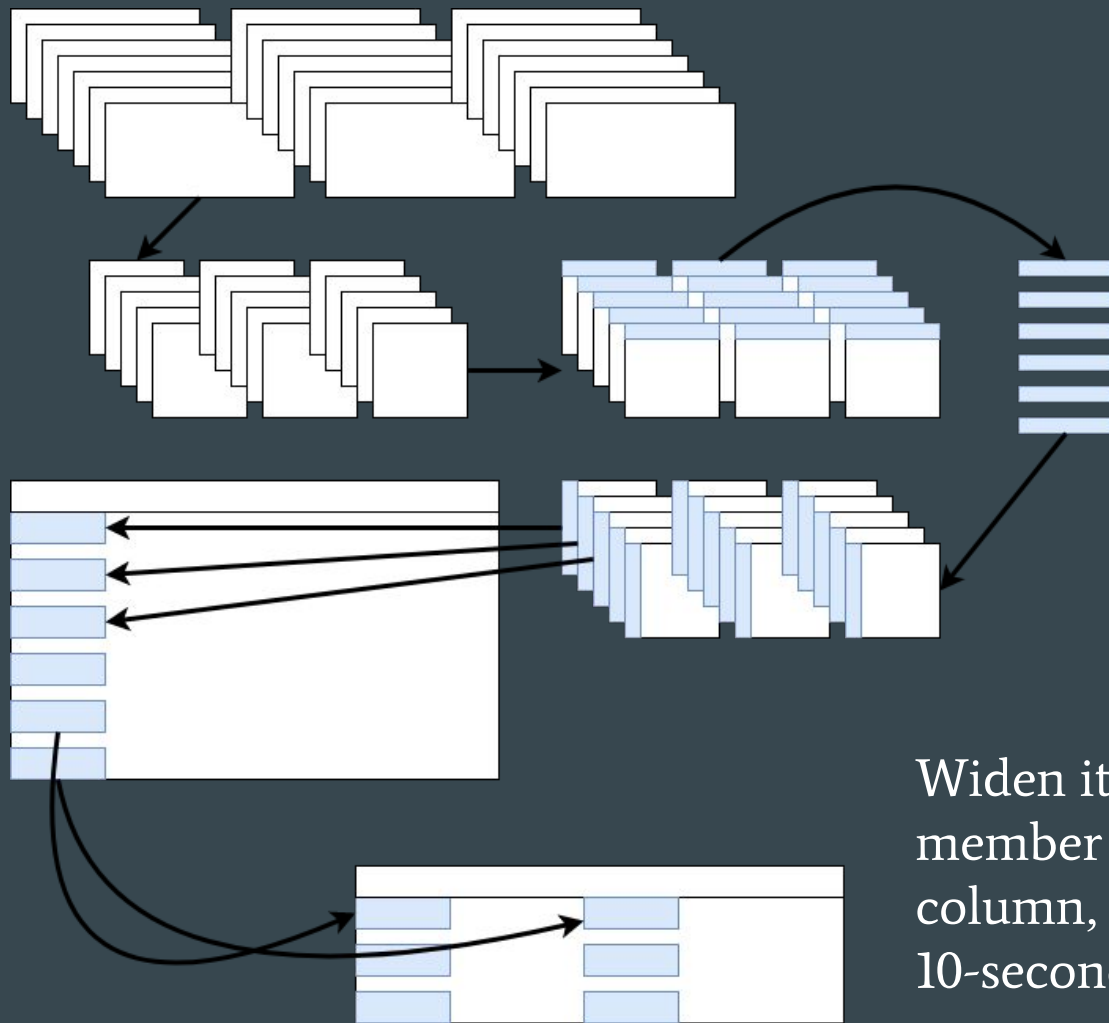

Make a list of dataframe names separate from the dataframes

Steal strings from dataframe name, insert as variables in each dataframe

Merge it all together into a
longform dataframe

Widen it so each dyad member has its own column, smooth into 10-second intervals
